

Movie Ticket Booking Management Application

Congratulations on completing your application definition! This document presents a summary overview of your application as defined in the Pega platform. It encapsulates the key elements of your application's design, highlighting its core functionalities and overall structure.

Please note that this is a high-level view and does not include granular details like data models or sample data. It's an ideal resource for a quick reference, facilitating discussions among team members and stakeholders, and for guiding strategic decisions in your application development process.

Blueprint ID: BP-2403442

Application Context

The Movie Ticket Booking Management Application is designed to provide a simple and efficient platform for customers to search for movies, select theatres and show timings, choose seats, make payments, and receive booking confirmations. The application will also help theatre administrators manage movies, screens, show schedules, seat availability, and bookings.

1. Movie Search and Selection The system will allow customers to: Search for movies by name, language, genre, or location. View movie details such as title, description, duration, language, genre, and rating. View available theatres and show timings for the selected movie. Select a preferred theatre and show.

2. Seat Selection The system will: Display the real-time seat layout for the selected show. Show available, booked, and temporarily reserved seats. Allow customers to select one or multiple available seats. Prevent two customers from booking the same seat. Calculate the total ticket amount based on the selected seats.

3. Ticket Booking After selecting seats, the customer can: Review movie, theatre, show, and seat details. Enter customer/contact information. Confirm the booking. Proceed to payment. Once payment is successful, the system will generate a unique booking ID and electronic movie ticket.

4. Payment Management The application will: Calculate the total booking amount. Support online payment processing. Track payment status such as Pending, Successful, Failed, or Refunded. Confirm the booking only after successful payment. Handle failed payments without permanently blocking seats.

5. Booking Confirmation After successful payment: The system will generate a booking confirmation. The customer will receive the ticket through email/SMS or the application. The ticket will contain the movie name, theatre, screen, date, show time, selected seats, booking ID, and payment details. The booking status will be updated to Confirmed.

6. Cancellation and Refund The system will allow customers to: View their upcoming bookings. Cancel eligible bookings according to the cancellation policy. Automatically update seat availability after cancellation. Initiate refunds for eligible cancelled tickets. Track refund status.

7. Theatre and Movie Management Theatre administrators will be able to: Add and update movie information. Manage theatres and screens. Create and modify show schedules. Configure seat layouts. Monitor seat availability. View booking and payment information.

8. Notifications The application will automatically send notifications for: Booking confirmation. Payment confirmation. Booking cancellation. Refund processing. Show schedule changes or cancellations.

9. Data Objects The application can maintain the following major data objects: Data Object Key Information Customer Customer ID, Name, Email, Mobile Number Movie Movie ID, Title, Genre, Language, Duration, Rating Theatre Theatre ID, Name, Location, Screens Show Show ID, Movie, Screen, Date, Time Seat Seat Number, Type, Price, Availability Booking Booking ID, Customer, Show, Seats, Amount, Status Payment Payment ID, Booking ID, Amount, Payment Status Refund Refund ID, Booking ID, Amount, Refund Status

10. Main Case Types For a Pega Blueprint design, the initial application can use:

1. Movie Ticket Booking Search Movie → Select Theatre → Select Show → Select Seats → Review Booking → Payment → Confirmation

2. Booking Cancellation Select Booking → Validate Cancellation → Cancel Ticket → Initiate Refund → Confirmation

Expected Outcomes The application should provide a fast, reliable, and user-friendly movie booking experience, reduce double-booking and manual theatre operations, provide real-time seat availability, automate payment and notification processes, and improve overall customer satisfaction.

Organization name	Location	Industry	Language
Internet Service Provider	India	Other	English

Application Architecture

Users access the application through defined channels, assume specific roles, and trigger workflows that manage how work progresses. Those workflows operate on shared Data Objects to ensure the system stays consistent and up to date.
